

Touchscreen Control Systems

B.L.Acoustics Ltd can produce custom control system User Interfaces that can control any remotely-controlled or monitored hardware. Our open-architecture design approach means that we maximise flexibility and minimise costs, allowing us to employ both off-the-shelf and specialist hardware as core components and extend functionality almost without limitation.

We can generate customised, Standalone or Client/Server control programs that can control any device over any protocol.

Our open approach to system architecture means that we can also utilize non-proprietary hardware to control any type of system. Interfaces can be deployed on a desktop, laptop, tabletPC or UMPC, and gateway devices or custom interfaces used to control the required hardware. This means that overall, BLAcoustics can provide solutions which can be deployed at a fraction of the programming time and hardware cost of conventional control systems.
